## BRAKE LIGHT FLASHER / LED TAILLIGHT INSTALLATION INSTRUCTIONS

The installation of the Brake Light Compatibility Module is very straight-forward:

1. Place ¼" ring under one of the grounding bolts on wire clamp (in front of battery).
2. Route wires and Brake Light Compatibility Module along right side of shield loom.
3. In main cruise control kit instructions, when it says to splice the CCWH red with yellow wire into the red with yellow wire of the main harness, also splice in the red with yellow wire from the free end of the device.
4. Continue main cruise control kit installation where you left off. Make sure that any splices into the main wiring harness (such as those by the ECM) are not spliced into a removable flasher unit or an add-on performance unit. This will make removal/replacement of the flasher/performance unit easier if required in the future.
